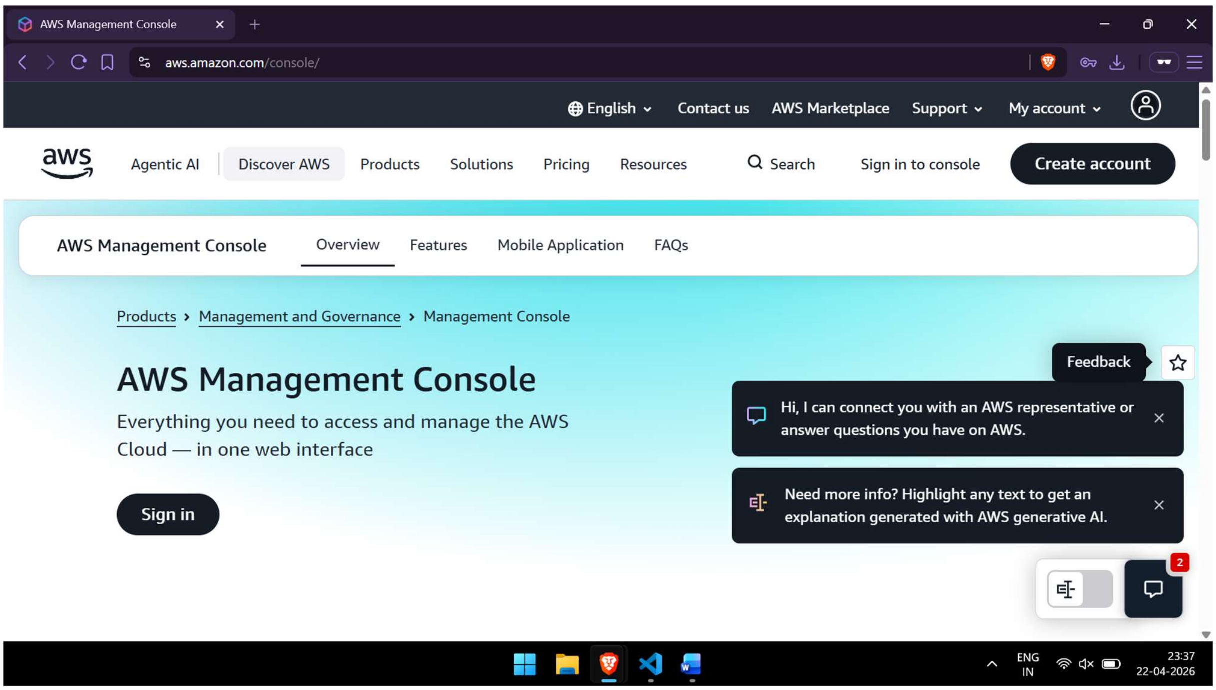
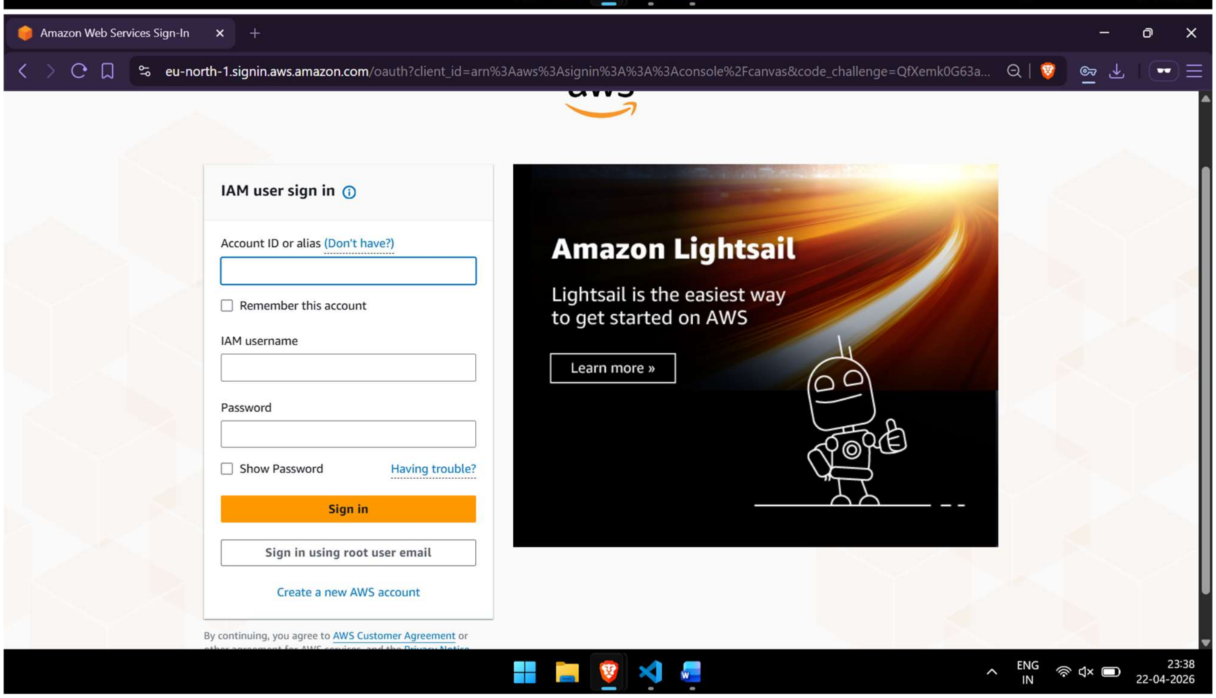
Cloud Assignment – April 22, 2026

AWS Organizations

Step 1: Login to AWS (Management Account)

Navigate to https://aws.amazon.com and click on **Sign In to the Console**. Enter your root account credentials (email and password) for the Management Account. Ensure you are logged in as the root user or an IAM user with sufficient permissions to manage AWS Organizations.

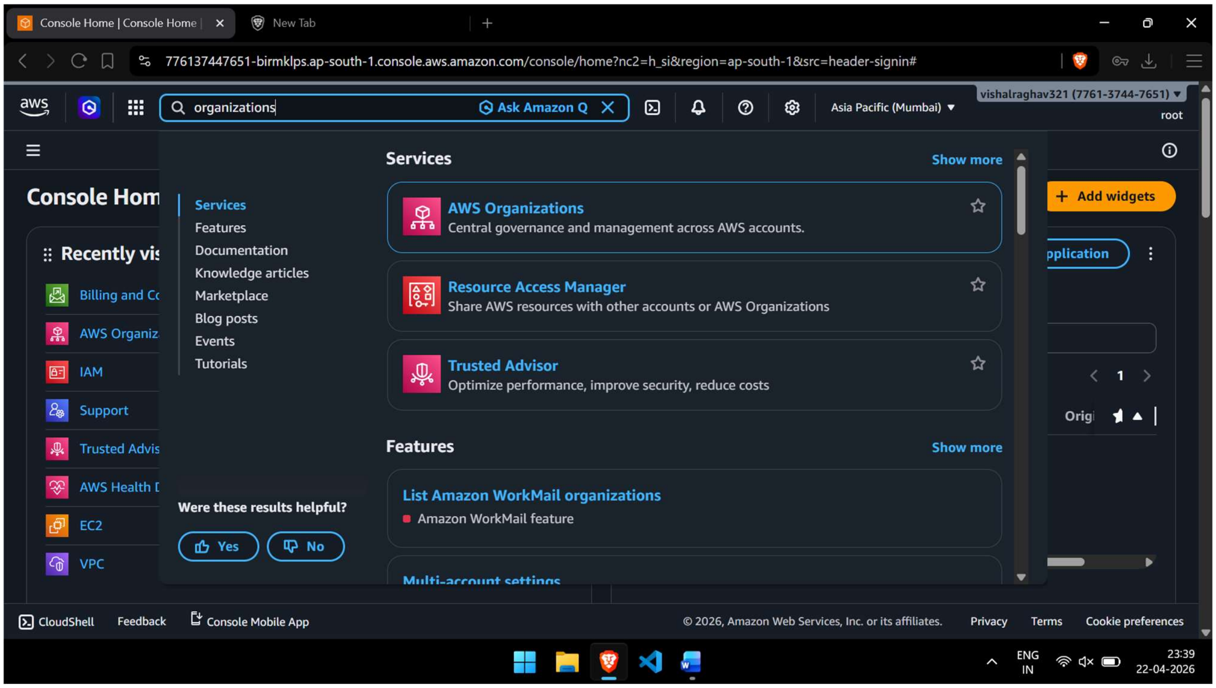




Step 2: Open AWS Organizations

Once logged in, search for **Organizations** in the AWS Management Console search bar. Click on **AWS Organizations** from the results. You will be directed to the AWS

Organizations dashboard where you can manage your organization.

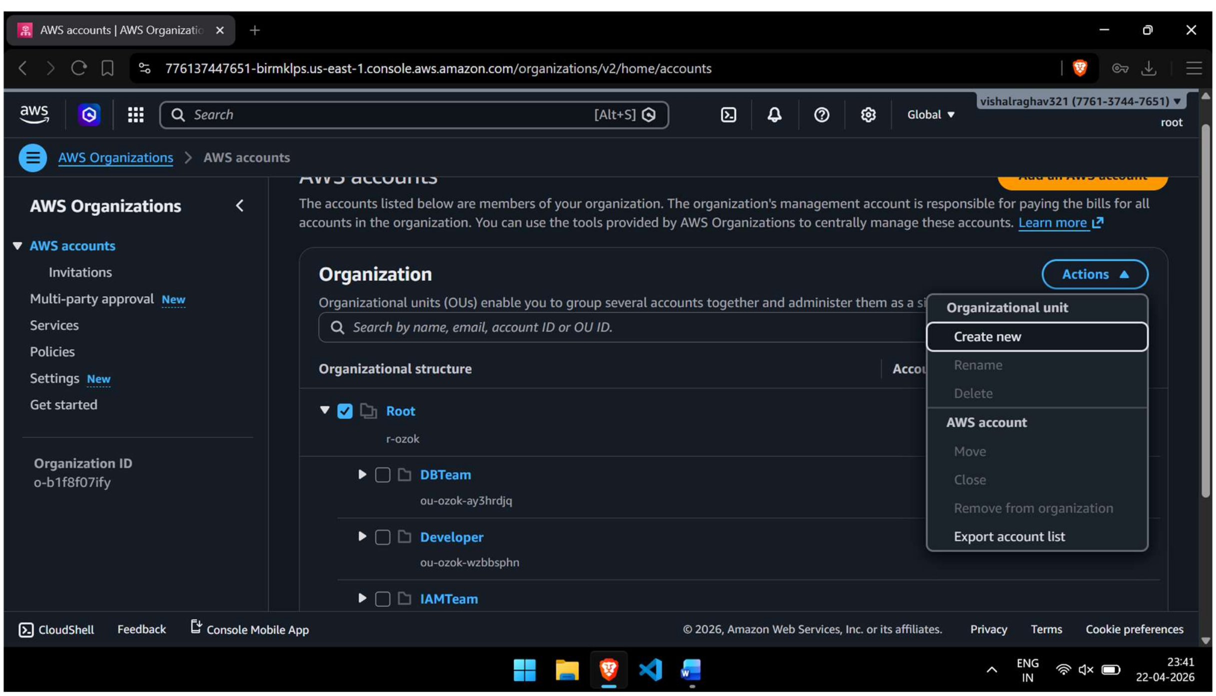


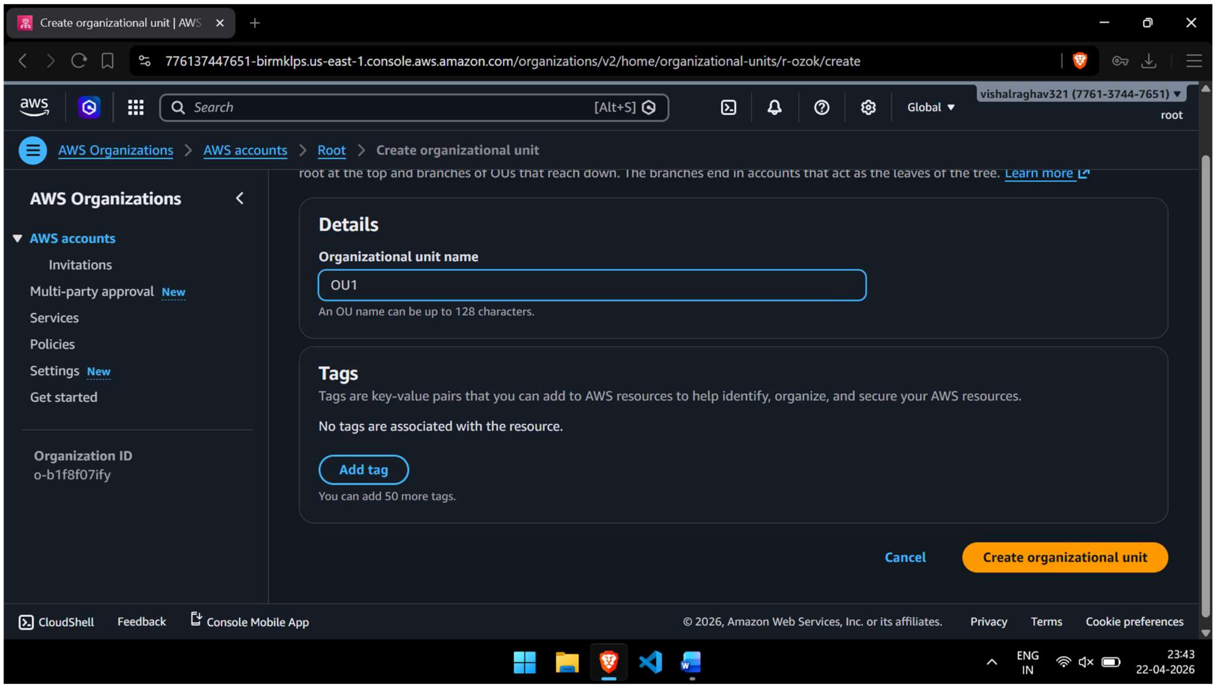
Step 3: Create Organization

On the AWS Organizations page, click **Create an organization**. AWS will prompt you to confirm. Click **Create organization** to proceed. The management account becomes the root of the new organization. A confirmation banner will appear once the organization is successfully created.

Step 4: Create Organizational Unit (OU)

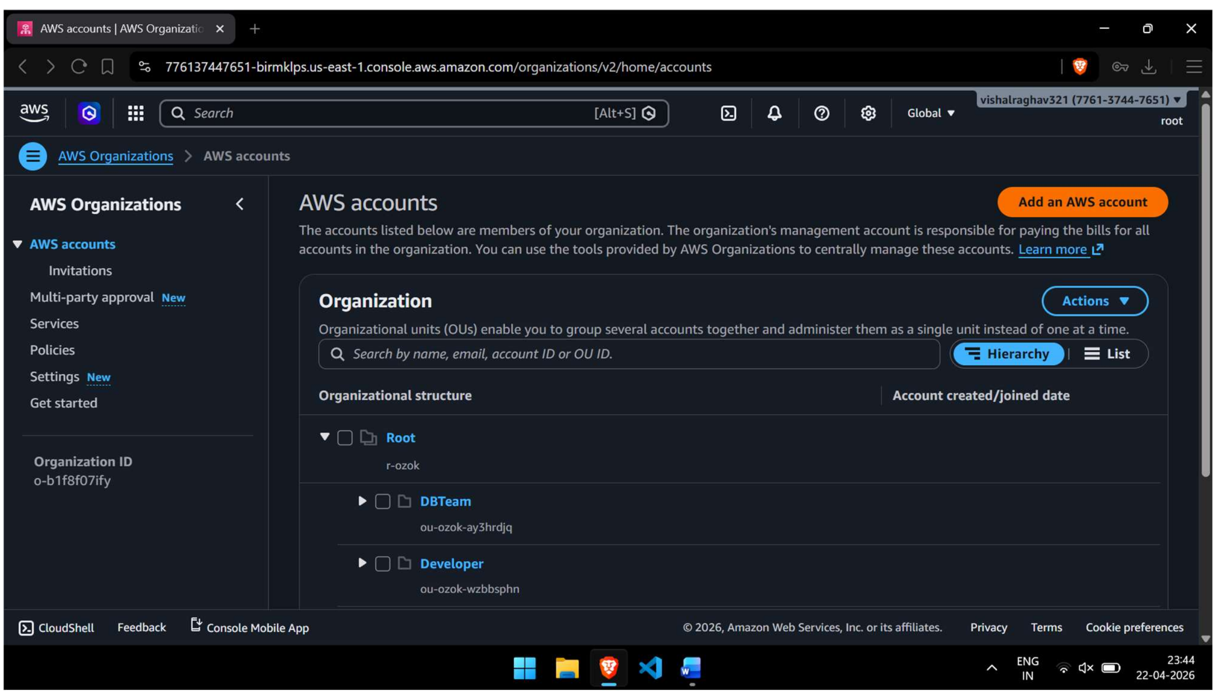
In the AWS Organizations console, select the Root under the Organizational structure. Click **Actions** → **Create new**. Enter a name for the Organizational Unit (e.g., "Production-OU" or "Dev-OU"). Click **Create organizational unit**. The OU will appear under Root in the hierarchy.

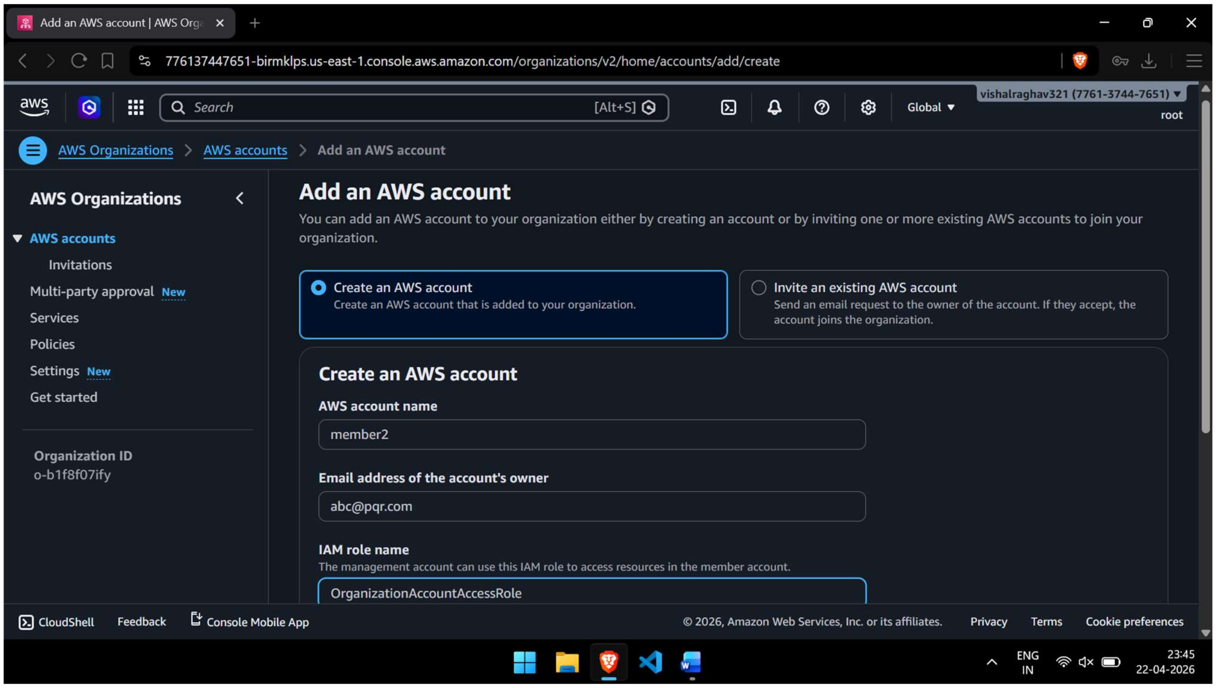


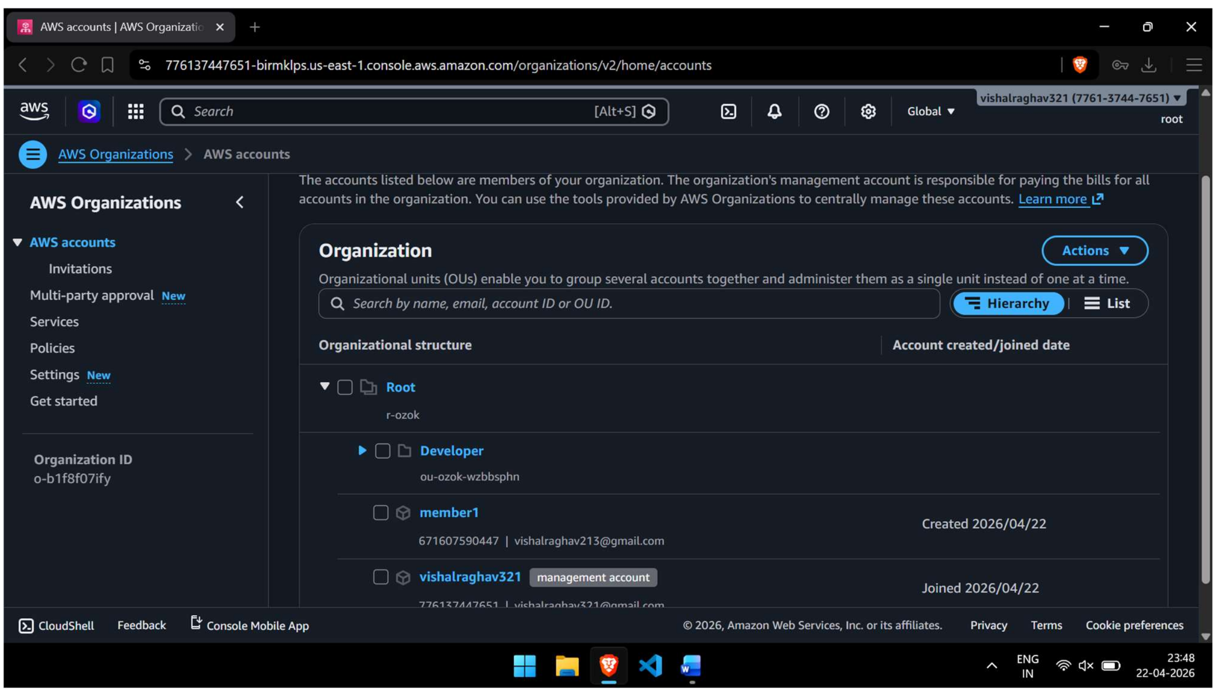


Step 5: Create Member Account

In the AWS Organizations console, click **Add an AWS account** → **Create an AWS account**. Enter the Account name, Email address (must be unique), and IAM role name for cross-account access. Click **Create AWS account**. The new member account will appear under the Root with a status of Active once provisioned.







Step 6: Move Account to OU

In the organizational structure, locate the newly created member account under Root. Select the account checkbox, then click **Actions** → **Move**. Choose the target Organizational Unit (OU) you created in Step 4. Click **Move AWS account**. The account will now appear under the selected OU.

Move AWS account 'member1'
When you move an AWS account from one organization unit (OU) to another, it changes the policies that apply to the account. This can change the permissions for the account and how supported AWS services can interact with the account. Learn more

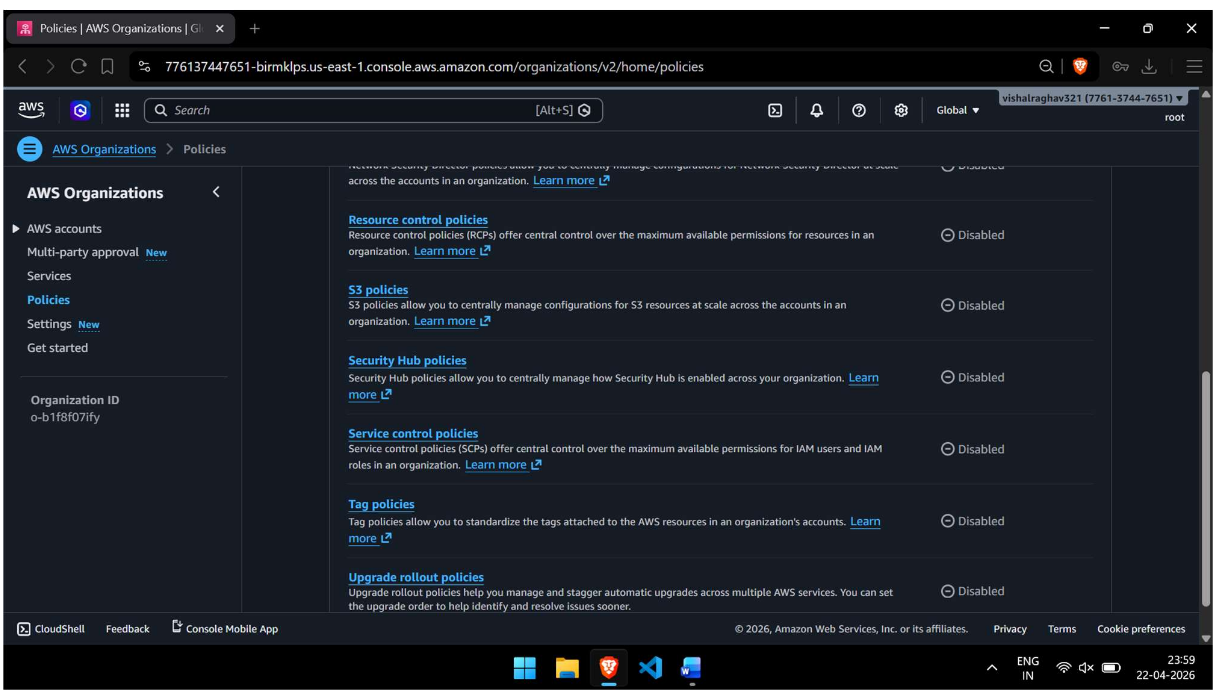
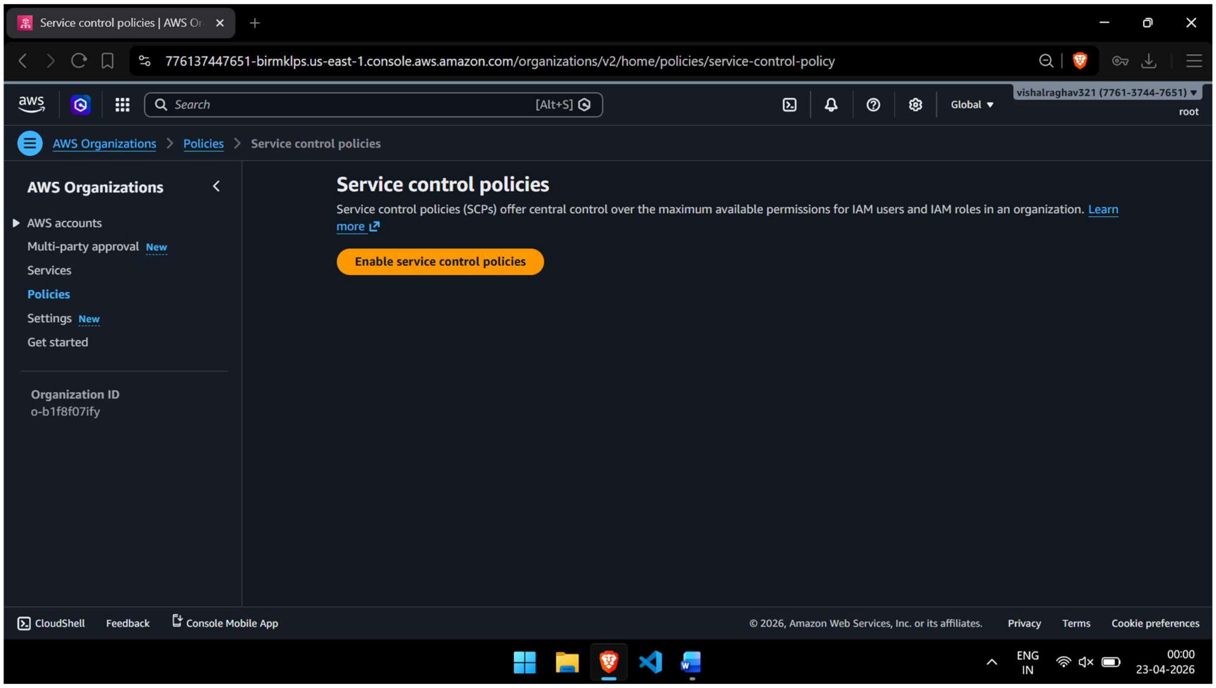
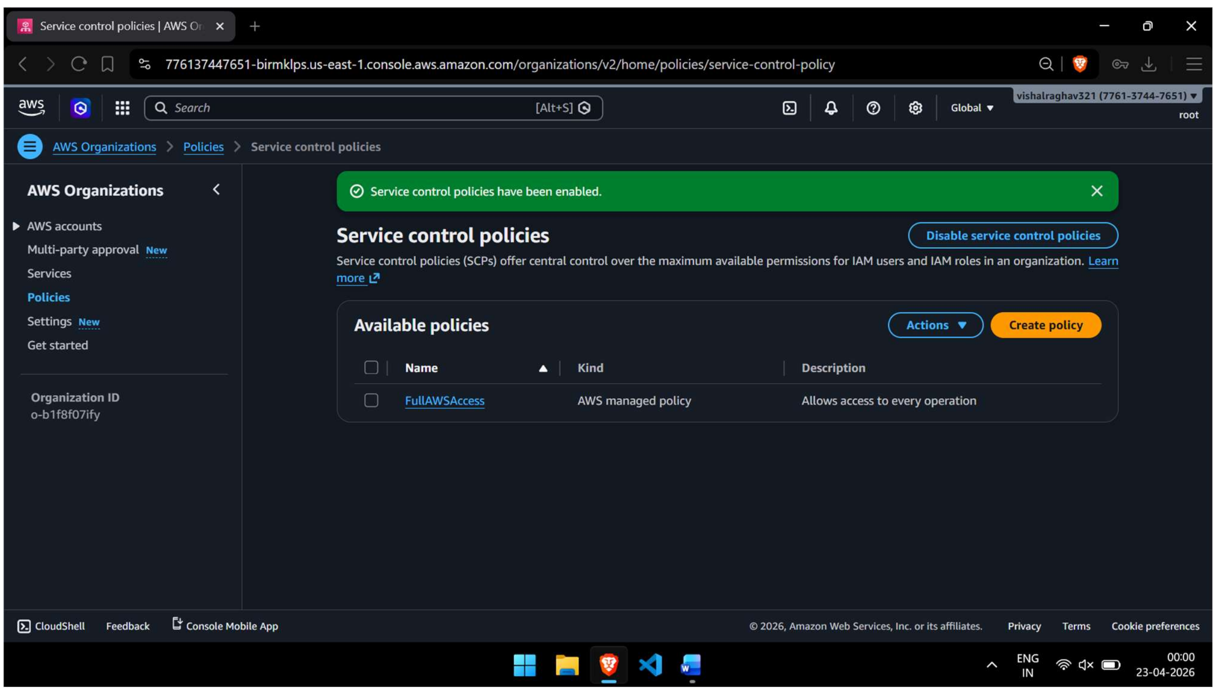
Step 7: Enable Service Control Policy (SCP)

Navigate to **AWS Organizations** → **Policies** → **Service control policies**. Click **Enable service control policies**. A confirmation message will appear. Once enabled, you can create and attach SCPs to OUs and accounts. Note: SCPs are available only for Organizations with all features enabled.





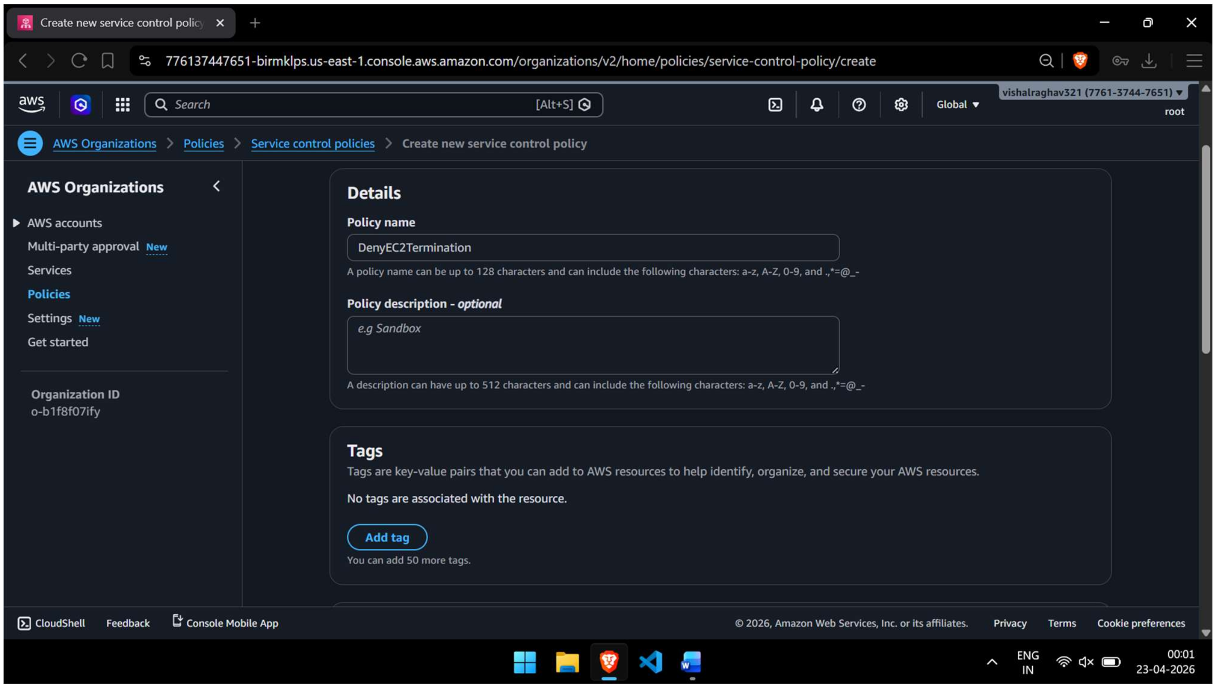


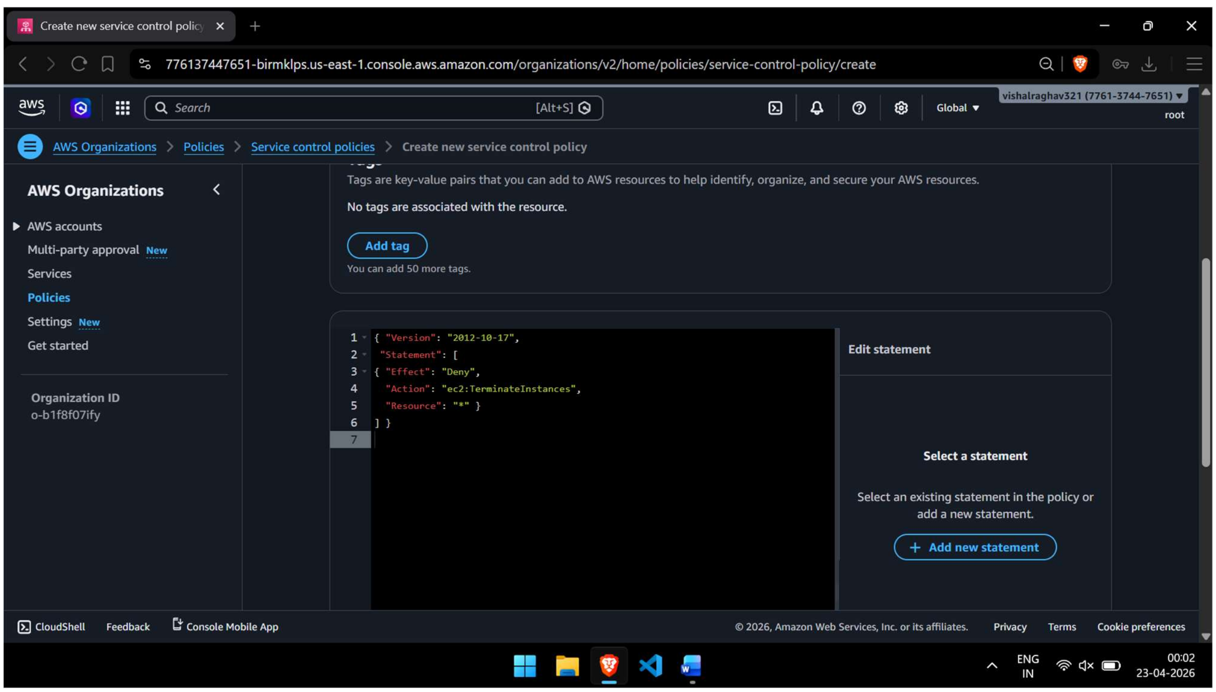
Step 8: Create SCP Policy

Under Service control policies, click **Create policy**. Enter a Policy name (e.g., "DenyEC2Termination") and optionally a description. In the policy editor, define your JSON policy. For example, a policy to deny EC2 instance termination:

```
{ "Version": "2012-10-17",
 "Statement": [
      { "Effect": "Deny",
        "Action": "ec2:TerminateInstances",
        "Resource": "*" }
      ] }
```

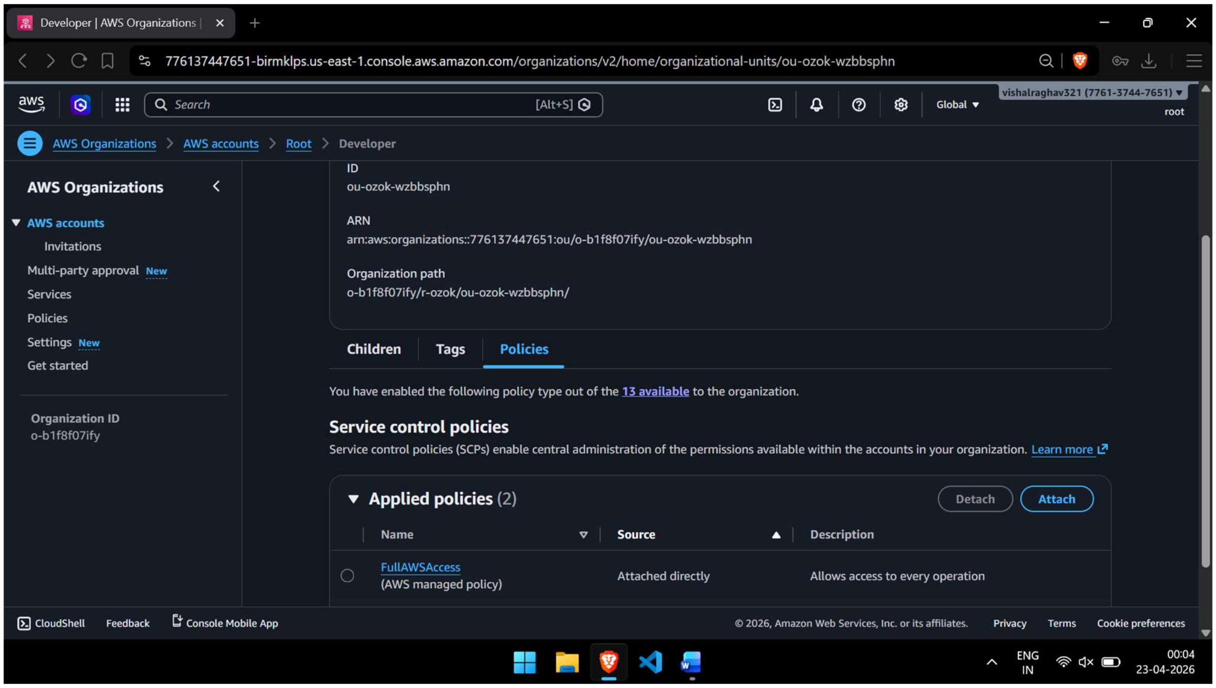
Click **Create policy** to save.

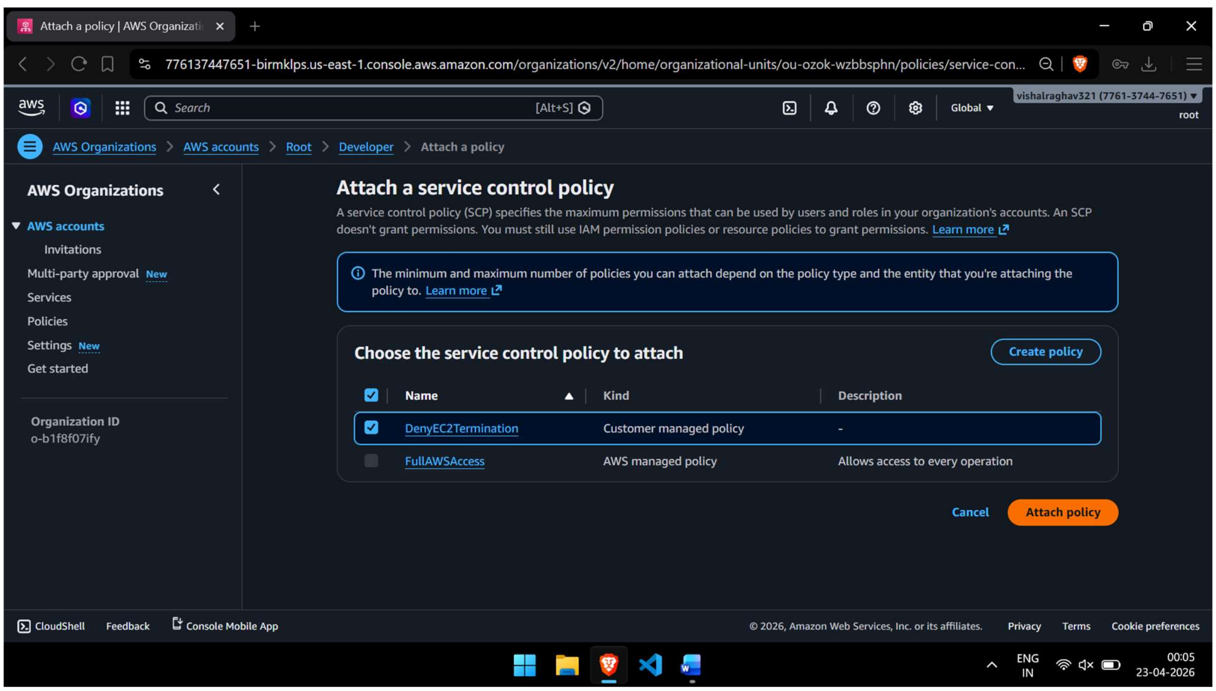




Step 9: Attach Policy to OU

In AWS Organizations, navigate to the OU you created. Select the OU and click **Policies → Attach**. Select the SCP policy you created in Step 8 from the list. Click **Attach policy**. The SCP is now applied to all accounts within the OU, restricting or allowing actions as defined in the policy.





Step 10: Verify the Implementation

To verify, log in to the member account that was moved to the OU. Attempt to perform an action that your SCP denies (e.g., try to terminate an EC2 instance if you applied the deny policy). You should receive an Access Denied error, confirming the SCP is active. You can also navigate back to **AWS Organizations** → **Policies** to see the attached policies listed under the OU.
